Pre-processing
Keep one row per distinct skill: dedup_primary = 1, filename = SKILL.md, valid front matter, not a symlink, non-empty body
Split content into front matter and body, and the body into prose and code
Attach bundle files: siblings join on repo_full_name + path = artifact_path, not file_sha
Size calculation
Count tokens with the Anthropic tokenizer for each tier: description, body (prose + code), and bundle (text files only)
Flag the bundle as unreliable when composition_truncated = 1
Count non-blank lines and words for the body, and lines and tokens for bundled scripts (code baseline)
